Domain: AI/ML

Problem Statement

- Student records, course enrollments and scores are often kept in scattered spreadsheets
- No single view of a student's progress across courses
- Instructors can't easily see who is struggling or inactive until it's too late
- Certificates are issued manually, which causes errors and delays

Solution

- A Python desktop app (Tkinter GUI) backed by a PostgreSQL database
- Admins add, update and delete students and courses, and manage enrollments, with no SQL needed
- Tracks module completion and scores for every student
- Auto-generates certificates and reports such as course completion rate and top scorers

ER diagram of the database

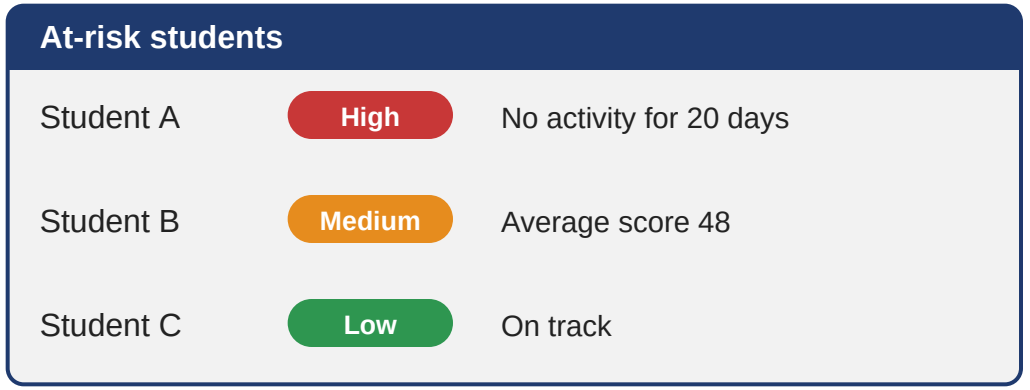

Unique Features

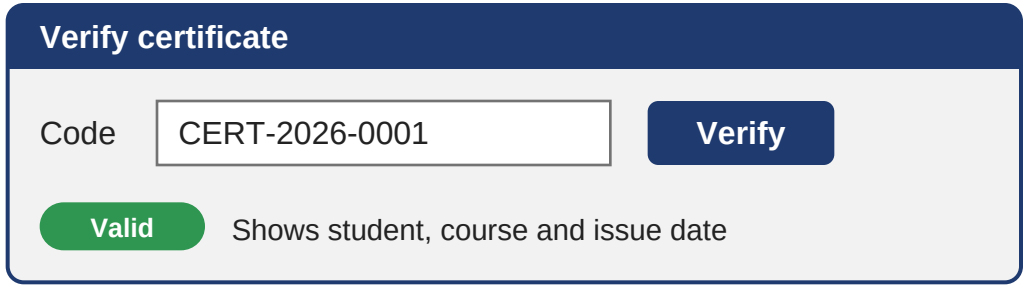

1. Early-Warning Risk List

- Labels each student Low, Medium or High risk
- Shows the reason, such as no activity for 20 days or a low average score

2. Certificate Verification

- Enter a certificate code to check it is genuine
- Shows the student, course and issue date
